Surface Mount Dual Toroid Inductors

The PM3602 and PM3604 Series are versatile surface mount coils that can provide different functions in a single package. A bifilar method is used in the winding of these coils. The user can utilize these coils in four different ways, depending on the external connection chosen:

(1) Parallel Connection:	Doubles the current capacity
(2) Series Connection:	4 times the parallel inductance
(3) Dual Inductor:	Creates two differential mode inductors
(4) 1:1 Ratio Transformer:	For isolation and some flyback applications

Features:
• Toroidal core design to minimize RFI radiation • Low loss core material • Encapsulated in case for pick and place capability • Reflow soldering • Hi-pot 500V • Operating ambient temperature: -40°C ~ 85°C

Typical Applications:
• Switching power supplies • Converters • Data communications • Processor/controller circuits • Personal computers • Filters

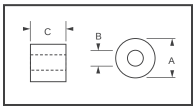
Ferrite Beads



The addition of a Ferrite Bead to a piece of wire causes the impedance of the lead to increase and acts like a small RF choke at high frequencies. It is possible to dissipate high frequency parasitic signals and attenuate undesirable frequencies that travel on DC circuits by the use of beads.

MMZ – Digital Signal Line Application
MPZ – Power Supply Line Application

MATERIAL CHARACTERISTICS

A Material: This high-impedance product is based on the impedance frequency characteristics of our Y-material. The product offers excellent impedance characteristics, which is greater than 2500Ω, in the vicinity of 100MHz range (MMZ1608A252B).

B Material: This type is perfectly suited for fast digital signals. By equalizing R components and X components that beads possess at a frequency of 5MHz, it is able to suppress overshooting, undershooting and ringing of fast digital signals.

D Material: For applications calling for low insertion loss at low frequencies and sharply increasing impedance at high frequencies. Designed for high impedance at high frequencies (200 ~ 500MHz) for signal line applications.

R Material: For digital signal line applications.

S Material: For signal line applications in which the blocking region is near 100MHz.

Y Material: High frequency range type intended for the 100MHz region and above. For signal line applications in which the signal frequency is far from the cutoff frequency.

3-Terminal Filters for Signal Line and DC Power Line / SMD – ACF and ACH Series

RoHS COMPLIANT

Features:

- The ACF and ACH series are T-type EMC filters incorporating ferrite chip beads and multi-layer ceramic chip capacitors.
- The external structure consists entirely of ferrite, enabling these parts to achieve superior attenuation characteristics despite their extremely compact dimensions.
- Because they can be mounted on edge, the ACF and ACH series are ideal for high-density circuit configurations.
- Operating Temperature Range: -25°C ~ 85°C

EMI Suppression Ferrite Chips and Arrays

BLM15 Series: The BLM series comprises the A series for standard, and the B series for high speed signal. Parts are lead free.- The BLM-A series generates an impedance from the relatively low frequencies. The BLM-A series is effective in noise suppression in the wide frequency range (30MHz – several hundred MHz). The BLM-B series can minimize attenuation of the signal waveform due to its sharp impedance characteristics. Various impedances are available to match signal frequency. The BLM-B series has sharp impedance characteristics.

BLM18 Series: The chip ferrite bead BLM18H series comprises ferrite bead inductors in the shape of a chip. This inductor generates a high impedance which at high frequencies mainly consists of a resistance element. The BLM18H series is effective in circuits without stable ground lines because the BLM18H series does not need a connection to ground. The BLM18HG, BLM18HD series has a modified internal electrode structure, that minimizes stray capacitance and increases the effective frequency range. The BLM_H series can provide higher levels of impedance well into the GHz range. The BLM18HG is intended for standard signal lines as this series provides significant impedance across a broad frequency range. The BLM18HD provides a sharper roll-off after the cut off frequency. This series is ideal for high speed signal lines.

BLM31 and BLM41 Series: Series can be used in high current circuits due to its low DC resistance. It can match power lines to a maxium of 6A DC (BLM41P).

BLA31 Series: The BLA31A/B is capable of filtering 4 circuits in a 3216 package size. BLA31A/B is suitable for EMI suppression in smaller digital equipment.

LC Combined Chip EMIFIL

NFL18ST Series: The NFL18ST series is an EMI suppression filter for high speed signal lines, achieving T-type structure in 1.6 x 0.8mm size with Murata's multilayer technology. Noise suppression for video signal lines (RGB lines) and high speed clock lines.

NFL21S Series: Murata's original internal structure design enables excellent noise suppression up to high frequencies. Available in five different values of cut off frequency ranging from 20MHz up to 500MHz.

NFW31S Series: The signal line chip EMI filter NFW31S series consists of high performance EMI suppression filters LC combined wound type. They are designed for noise suppression in high speed signal digital circuits in which the signal harmonics are prone to becoming noise sources. These filters achieve a 100dB/dec. (typical) damping characteristic with Murata's innovative circuit design. This makes these chips effective in applications where the signal and noise frequencies are close to each other.

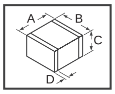
Power Inductor Chip / Monolithic Surface Mount



Steward's DI2220V301R-10 is a surface mount, high current power inductor (in the industry's smallest package) with exceptional performance under DC Bias. Very low DCR provides superior thermal performance under DC bias. This compact, monolithic component produces flat inductance over the driven current range (from 3 to 8 amps) comparable to a larger, heavier, wire-wound toroidal inductor. EMI resistant, fully shielded internal coil. Tuned to work with the new generation of high frequency multiphase DC-DC converters. Mounting can be on back side of PC boards. Low profile, small footprint and vibration resistant.

Common Mode EMI Filters

SMD Common Mode Arrays for Power and Signal EMI Filtering

An advanced family of ferrite common mode choke arrays provides electromagnetic interference EMI filtering for both power and data lines in one part. High continuous operating current capability (5 Amps). Very low normal mode impedance allows desired signals to pass. Parts have no crosstalk. One single part can be used as a multi-line array or installed as a multi-pass choke in series to multiply impedance. Excellent filters for USB, Firewire and RJ11 to RJ45 Modular Data/Power Port applications. DCR Maximum is 0.020 Ω. Will easily fit behind connector port jacks.

Differential Mode Surface Mount and Through Hole Ferrite EMI Filters

Differential Mode Multi-Line Arrays for Power EMI Filtering

3, 4, 5, & 8 Line Filters Rated up to 10 Amps Continuous Operation

These multi-line ferrite products provide economical EMI filtering of differential mode noise in surface mount and through-hole PCB applications. They are designed to provide high frequency suppression of both common and differential mode EMI noise on groups of data/power lines. The surface mount differential mode EMI filters are rated for up to 9 Amps continuous operation per filtered line (channel) and the thru hole filters are rated up to 10 Amps continuous operation per line. Rugged construction provides protection against transient events as well as much higher peak current handling capability than most other EMI suppression devices. Low DCR.

Steward

Ferrite EMI Disks and Plates with Adhesive

Steward's Ferrite Disks and Plates provide a simple, cost-effective solution for radiated and inductively coupled electromagnetic interference. After the PC board soldering process, a ferrite disk or plate can be installed directly on the source of EMI (such as active devices or unwanted antennas). Can also be utilized either as inductively-coupled components or EMI shields on PC board components and traces.

Inductive Coupling occurs when the ferrite affects the conducted wave form leaving the active component. The rise time of the wave form is effectively slowed by the ferrite, and the overshoot and associated ringing are attenuated. EMI shielding occurs when the ferrite absorbs the radiated EMI emissions from active components, effectively protecting other boards or components in the vicinity from radiated contamination. Performance varies with each application.

Features: • Parts have 3M double sided permanent adhesive • Can be used to locate unwanted EMI antennas • Flat Flex and Ribbon Cable Shields • Provides retrofit auxiliary EMI attenuation

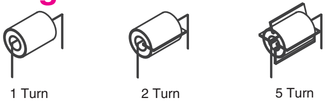
Ferrite EMI Cores for Cables and Wiring Harnesses

Low Frequency (300 KHz – 30 MHz) Cores for Round Cables

Steward LFB ferrite material provides excellent impedance at lower frequencies. Optimum EMI attenuation is between 300 KHz and 30 MHz however, with additional wire turns, much broader EMI frequencies can be effectively attenuated.



Additional wire turns will multiply impedance.

Ferrite Cylinders and Toroids for Electromagnetic Interference (EMI) Broad Band (optimized 30 MHz – 800 MHz +) Bead Cores for Round Cables & Wire Bundles

Fig. 1

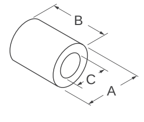

Fig. 2

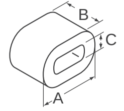

One-piece ferrite tubular bead cores for effectively attenuating a broad range of conducted and radiated electromagnetic interference (EMI). Install over round cables or wire bundles. Ferrite beads can be over molded or covered with heat shrink coating if desired. Additional wire turns will multiply impedance. Steward's cylindrical beads for round cables in Broad Band 28 material provide the smallest and most cost effective EMI solution when filtering both common mode and differential mode EMI on internal and external cable assemblies. By using Steward's high performance material, one is able to use the smallest and lowest weight core size possible with the highest EMI attenuation performance available.

Clamp-On, Split Ferrite Cores in Plastic Cases for Round Cables and Wire Bundles

Split ferrite bead cores in clamp-on (or snap-on) plastic cases can be easily used for EMI attentuation where one-piece cores cannot be installed. Clamp-on cores are also convenient for use during EMI testing.
Cylinder, Round and box shaped plastic cased part shapes available. Additional wire turns will multiply impedance. High performance material.

Power Entry Modules

C Series: The C series is a two-function power entry module combining a DPST switch and an IEC 320 power line connector.

EC Series: This series of filtered power entry modules provides the highest attenuation of any standard filter available in a package size limited by the dimensions of the integral IEC connector. These filters combine high common-mode inductance with high differential-mode capacitance and minimal parasitic elements, for effective attenuation of line-to-ground and line-to-line noise across the frequency range.

ED Series: These filtered power entry modules are more effective than general purpose filters in applications where line-to-line and low frequency line-to-ground noise must be controlled.

EEA Series: A new design in both the internal structure and manufacturing process makes this series cost effective and compact.

EF Series: This rugged international series of filtered power entry modules incorporates the special IEC power line connector. They are UL recognized, CSA certified, and VDE and SEV approved. Models with F suffix are SEMKO approved and comply with BSI standards.

GG Series: The GG series power entry modules combine the functions of a general purpose RFI filter with IEC power cord connector and single or dual metric fusing, in the smallest possible panel space.

EEJ Series: The 1-15 Amp versions are flange mounted and mechanically equivalent to the EEA/EEB series. The performance has been enhanced to meet the needs for more attenuation. It also has an extended metal flange around the socket for improved high frequency EMI shielding. The EEJ series also includes a 20 Amp version that uses the inlet IEC 320/C20.

EJH Series: The 1-15 Amp versions are flange mounted and mechanically equivalent to the EAH/EBH series. The performance has been enhanced to meet the needs for more attenuation. It has an improved high frequency EMI shielding and larger contact area for the panel ground. These medical filters are designed to provide common and differential mode performance while maintaining the UL leakage requirements for medical and dental equipment. The EJH series also includes a 20 Amp version that uses the inlet IEC 320/C20.

EJS Series: The 1-15 Amp versions are snap-in mounted and mechanically equivalent to the EAS/EBS series. The performance has been enhanced to meet the needs for more attenuation. It has improved high frequency EMI shielding. The EJS series also includes a 20 Amp version that uses the inlet IEC 320/C20.

H Series: The H series was developed specifically for health care applications. These products are suitable for uses in both patient care equipment and non-patient care equipment. Their extremely low leakage current allows compliance with UL544 and CSA 22.2 health care specifications.

P Series: This series of power entry modules offers full flexibility of design in the most compact package. As the first 10 Amp module to provide all five power entry functions in one compact design, the "Chameleon" readily adapts to its environment and the needs of international markets. • Snap-in or flange mounting • IEC power line connector • Both North American and European fusing capabilities • Two voltage selection • Optional DPST on/off switch • Filtering options for general purpose and medical applications.

J Series: The most widely accepted of all the power entry modules, the J series combines an IEC connector, 2 voltage, or 4 voltage selection, and a North American fuseholder.

LA Series: A multi-function power entry connector with a choice of filtering capabilities. The series features an IEC line connector, selectable North American or dual European fusing capabilities, DPST on/off switch and 120/240 voltage selection. The filtered LA units provide a one piece solution to all power entry needs and provide a filtering solution for almost any RFI problem. Their vertical design is flange mounted and will meet requirements for worldwide markets.

M Series: This series of power entry modules offers the most choices of power entry components and filtering options to fit a specific need.

SR Series: The SR series includes a full line of popular AC receptacles. These male and female power line connectors include snap-in and flange mounted models. All have complete safety agency approvals for worldwide usage.

RF Line Filters

B Series: These general purpose common-mode RFI power line filters effectively provide RFI control of line-to-ground noise in a small size at a low cost.

EDP Series: These RFI power line filters provide enhanced differential-mode performance for applications requiring more line-to-line protection.

EJT Series: The EJT Series is an IEC 320/C14 input connector. This product was designed to address the demand for more noise attenuation at higher frequencies in a compact inlet.

EOP Series: A general purpose filter which is effective in removing both common and differential-mode noise for susceptibility applications.

EP Series: The EP/VP series of RFI filters has been developed to reduce conducted noise to acceptable limits for equipment that must comply with requirements of CISPAR in Europe and the FCC specifications in the USA.

H Series: The H series filters were developed specifically for health care applications. These products are suitable for uses in both patient care equipment and nonpatient care equipment. Extremely low leakage current allows compliance with UL544 and CSA 22.2 health care specifications.

HT Series: This series of power line filters provides superior common-mode and premium differential-mode attenuation to RFI noise on the frequency range from 10KHz to 30MHz, for IEC601 and UL544 patient-connected equipment, as well as all other electronic equipment that cannot tolerate any leakage current.

K Series: These power line filters are general purpose common-mode and differential-mode filters. They are effective in the control of line-to-line as well as line-to-ground RFI interference. They are particularly suited in applications where pulsed, continuous and/or intermittent RFI interference is present.

MV Series: This series answers the need for a medical filter to help equipment comply with increasing noise sources in medical applications while still meeting leakage current requirements of UL2601.

N Series: The N series RFI filters are designed to provide superior common-mode attenuation for most digital electronic equipment (particularly switching power supplies) over the frequency range of 10KHz to 30MHz.

Q Series: A series of RFI power line filters that has been developed specifically for switching power supplies and is designed to be all the line filtering needed to control conducted emissions all the way down to 10KHz.

R Series: These dual T section RFI power line filters provide premium performance at a moderate cost. They are well suited for impedance loads where noisy RFI environments are present. They control pulsed, continuous and/or intermittent interference, insuring protection of your equipment from power noise in addition to protecting the line from equipment noise.

S Series: The S series of RFI power line filters combines successful line-to-ground interference rejection filters with additional circuitry designed to reduce line-to-line noise and transients.

SK Series: This series of RFI power line filters was designed to reduce conducted noise to acceptable limits for equipment that must comply with the FCC specifications in the USA and CISPAR specifications in Europe.

T Series: These RFI power line filters provide superior common-mode and premium differential-mode attenuation, exceeded only by that of Q series filters.

U Series: The U series was designed to meet the RFI needs created by power factor corrected power supplies. This high performance filter offers a high impedance circuit to mismatch the power supply's impedance characteristics.

V and W Series: These RFI power line filters will protect equipment from malfunctions due to conducted interference coming into the equipment from the line, especially line-to-line noise and transients. The W series has a two-stage construction that provides excellent suppression at high frequency.

X Series: This series was designed to bring most digital equipment (including switching power supplies) into compliance with FCC Part 15J, Class B conducted emission limits.

Z Series: A design that brings most digital equipment (including switching power supplies) into compliance with EN55022 Level B, (as well as FCC Part 15J, Class B) conducted emission limits.

Power Line EMI Filters

EB Series: General purpose EMI filters, which suppress high frequency conducted noise both into and out of the equipment through the power lines. The compact and low cost designs make these a good choice for cleaning up noisy power lines.

EK Series: General purpose EMI filters with enhanced differential mode performance. They are effective in suppressing both common mode and differential mode noise. This series is a very good choice when it is required to comply with basic EMI emission regulations, such as FCC-A and VDE-A.

ER Series: High performance EMI filters with multi-stage design for both common mode and differential mode noise suppression. This series is most useful when attenuation is required for compliance with stringent EMI emission regulations such as FCC-B and VDE-B.

HB Series: General purpose EMI filters specially designed for medical and dental equipment, both patient care and nonpatient categories. The leakage current in this series is extremely low to satisfy the stringent leakage current limit imposed by safety regulations for medical and dental equipment, such as UL544 and IEC601.

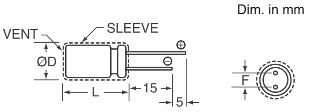
NEW! ELNA AMERICA, INC.

Audio Aluminum Electrolytic Capacitors

RFS Series



ELNA developed new raw material for the separate paper which uses a silk fiber. Therefore, this series can give high grade sound for any audio design. This series can be used to relieve the music's vibration energy, to decrease the peak feeling sound at high compass and rough quality sound at middle compass, and to increase massive sound at low compass.

Specifications: • Operating Temperature Range: -40°C ~ 85°C • Standards: JIS C5101-1, -4 1998 (IEC 60384-1 1992, -4 1985)

Panasonic Z Series Miniature Aluminum Electrolytic Capacitors

±20%, Low Leakage, Low Impedance

SPECIFICATIONS:

- **Operating Temperature:** -40°C ~ +85°C • **Rated Working Voltage:** 6.3 ~ 50VDC • **Rated Capacitance:** 0.1 ~ 2200µF • **Capacitance Tolerance:** ±20% • **Leakage Current:** I = 0.002CV + 1 (mA) max.; Where, I:-DC leakage current (µA) C:-rated capacitance (µF), V:-DC rated working voltage (V). Leakage current is measured after 2-minute application of the rated DC working voltage. • **Surge Voltage:** The listed surge voltage is applied to the capacitor in series with 1,000 ohms resistor at a cycle of 0.5 minute "ON" and 4.5 minute "OFF" repeating 1,000 times at 25°C ±10°C. After the test, the capacitor should meet the following limits:

Working Voltage	Surge Voltage
10VDC	13VDC

Capacitance change	Within ±10% of the initial measured value
tan δ	Less than 150% of the initial specified value
DC leakage current	Less than the initial specified value

- **tan δ. (Dissipation Factor) Max.**

Working Voltage	tan δ	D.F.
10VDC	0.17	17

0.06 for 1µF or less.

- **Low Temperature Stability:** Maximum impedance ratio against +20°C at 120Hz

Working Voltage	-25°C ~ +20°C	-40°C ~ +20°C
10V	2	4

- **Load Life:** After 2,000 hour application of DC working voltage at +85°C with specified RMS ripple current, the measurements should meet the following requirements:

Capacitance change	Within ±20% of the initial measured value
tan δ	Less than 200% of the initial specified value
DC leakage current	Less than the initial specified value

Ultracapacitors and Pseudocapacitors

The NessCap **Ultracapacitor (ESHSR Series)** is an Electric Double Layer Capacitor (EDLC) that uses an activated carbon powder and coating process to prepare electrodes. The NessCap ultracapacitor's high energy density is made possible through the use of a proprietary binder formulation and specially developed electrode-making process.

The NessCap **Pseudocapacitor (PSHLR Series)** differs from the EDLC in that is uses a metal oxide rather than an activated carbon for electrode material. With this advantage, pseudocapacitor cell needs to be only 60% in volume as compared to an EDLC of the same capacitance. Conversely, it also means the pseudocapacitor holds 80% more energy than the equivalent-size EDLC.

After the test, the capacitor shall meet the following limits: Capacitance change of ±20% of initial measured value, DC leakage current less than initial limits, and D.F. less than 150% of initial limits.

Ripple Voltage: The sum of the DC voltage plus the AC peak ripple voltage shall not exceed the rated DC voltage, and there shall be no application of reversed voltage.

Ripple Current (mA):

Frequency (Hz):	50Hz	60Hz	120Hz	500Hz	1KHz	10 ~ 50KHz
16V ~ 100V:	0.93	0.95	1.0	1.05	1.06	1.15
160V ~ 500V:	0.75	0.8	1.0	1.2	1.25	1.4

D.C. Leakage Current:
Measurements shall be made at rated working voltage at 20°C. The voltage shall be applied to the capacitor for a minimum period of 5 minutes before reading the leakage current. Maximum leakage current shall not exceed the value given by the following formula: 16 ~ 100V: in case of C X V = 100,000µFV I = 0.01CVµA maximum in case of C X V = 100,000µFV I = 3 v C x VµA maximum 160 ~ 450V: 1 = 3 v C x VµA maximum where I = leakage current in mA, C = rated capacitance in µF V = DC rated WV in volts.

Load Life Test:
The capacitor shall be subjected to application of the DC rated voltage with full rated ripple current in the specified ambient temperature for the specified life period. The capacitor shall then be removed from the test chamber and stabilized at room temperature. After reaching temperature stability, the capacitor shall not exceed the following specified values listed: Capacitance change within ±20% of the initial measured value, DC leakage current ≤5 initial limits, and D.F. 150% of the initial limits.

Panasonic® SP-Cap

Specialty Polymer Capacitor

CX Series Specialty Polymer Aluminum Electrolytic Capacitors, Surface Mount Type

RoHS COMPLIANT

Continuing the tradition of providing ultra low ESR solutions, in the Panasonic SP-Cap family, Panasonic has developed the CX Series. The CX series has a higher CV packing density which allows for better price performance. It also has a very good noise absorption properties, and is an excellent choice for input and output capacitor for CD-CD converters. Can withstand 260°C temperature.

Specifications:

• Category Temperature Range: -40°C ~ 105°C • Rated Voltage: 2V ~ 6.3V • Capacitance: 100µF ~ 330µF (120Hz 20°C) • Capacitance Tolerance: ±20% (120Hz 20°C)

TPS Series Low ESR Surface Mount Tantalum Capacitors

TPS surface mount products have inherently low ESR (equivalent series resistance) and are capable of higher ripple current handling, producing lower ripple voltages, less power and heat dissipation than standard product for the most efficient use of circuit power.

TPS has been designed, manufactured, and preconditioned for optimum performance in typical power supply applications.

TCJ Series Conductive Polymer Tantalum Capacitors

The TCJ Series of tantalum capacitors with a conductive polymer electrode offers lower ESR, safer non-ignition failure mode and better capacitance retention compared to the conventional Mn02 electrode capacitors. The TCJ series is suitable for power management systems with operating temperatures up to 125°C.

In addition, the TCJ Series complies with RoHS requirements and is an environmentally friendly component ready for lead free-assembly systems up to 3x reflow with 260°C peak temperature.

OxiCap™ Niobium Oxide Capacitors

Cost versus performance is a key requirement for consumer electronic products. A solid electrolyte capacitor OxiCap has been developed by AVX in standard EIA case sizes in order to meet this requirement as a higher performance alternative to aluminum and other SMT capacitor technologies currently on the market.

The OxiCap non-burn technology is based on NbO niobium oxide ceramic material as the anodic material processed through the same manufacturing process as tantalum capacitors.

The laser coded orange molded body gives total traceability.

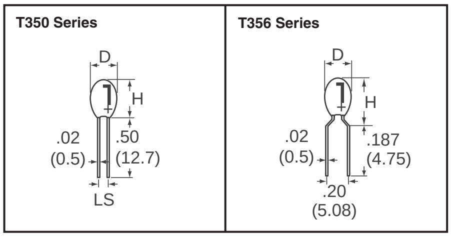
Tantalum Dipped / Radial Capacitors

T350 and T356 "UltraDip II" Series



The KEMET "UltraDip II" Series, miniature dipped solid tantalum capacitors, provide the designer with the advantage of compactness plus low leakage and low DF performance characteristics for filtering, bypassing, coupling, blocking and RC timing circuits.

The plastic case provides a tough barrier coating and maintains precision of lead wire spacing within ±0.015 inch.

All case sizes are printed with capacitance, voltage, polarity and vendor identification, these self-insulating cases are resistant to shock and vibration.

The gold color epoxy permits Laser marking with outstanding permanency and legibility.

Solid tantalum devices exhibit no degradation failure mode during shelf storage.

These capacitors exhibit low DCL, ESR and Impedance and have excellent temperature stability. *The ESR values provided are for reference only.*

- **Operating Temperature:** -55°C~85°C (125°C with voltage derating)
- **Capacitance Tolerance (%):** ±10

Molded Axial Tantalum Capacitors

T322 Series

The KEMET T322 Series offers a complete line of extended range molded solid tantalum capacitors. These capacitors offer an extremely high capacitance-to-volume ratio while still maintaining excellent performance characteristics.

Applications: Decoupling, blocking, bypassing and filtering in commercial computers, data processing, communications, and other electronic equipment. The low ESR/impedance at high frequencies offered by this capacitor is especially suitable for decoupling required by high speed computers. The ESR values provided are for reference only.

Specifications: Capacitance Tolerance (%): ±10 • Operating Temperature: -55°C ~ 85°C (125°C with voltage derating)

KEMET Surface Mount Tantalum Chip Capacitors

KEMET's family of solid tantalum chip capacitors are designed and manufactured with the requirements of surface mount technology in mind. These devices extend the advantages of solid tantalum technology to today's surface mount circuit applications.

Operating Temperature Range: -55°C ~ 125°C (T520 Series: -55°C ~ 105°C)

T491 Series — Industrial

The leading choice in surface mount designs. This product meets or exceeds the requirements of EIA standard 535BAAC. The physical outline and dimensions of this series conform to this global standard. This product was designed specifically for highly automated surface mount processes and equipment.

T494 Series — Low ESR, Industrial Grade

The T494 is a low ESR series that is available in all the same case sizes and CV ratings as the T491 Series. The T494 offers low ESR performance with the economy of an industrial grade device. This series is targeted for output filtering.

T495 Series — Low ESR, Surge Robust

Designed primarily for output filtering in switch-mode power supplies and DC-to-DC converters. The standard CV T495 values are an excellent choice for battery-to-ground input filter applications. This series offers several important advantages: Very low ESR, high ripple current capability, excellent capacitance stability and improved ability to withstand high inrush currents.

T496 Series — Fused

KEMET also offers a "fail-safe" fused solid tantalum chip capacitor. The built-in fuse element provides excellent protection from damaging short circuit conditions in applications where high fault currents exist. Protection from costly circuit damage due to reversed installation is offered with this device.

T510 Series — Ultra-Low ESR

KEMET's T510 Series offers the industry's lowest ESR in the popular EIA 7343-43 case size. The ultra-low ESR and high ripple current capability make it an ideal choice for SMPS filtering and power decoupling. KEMET has developed an innovative construction platform that incorporates multiple capacitor elements, in parallel, inside a single package.

T520 Series — KO-CAP Polymer Tantalum

The KO-CAP is a Tantalum capacitor, with Ta anode and Ta_2O_5 dielectric. A conductive, organic, polymer replaces the MnO_2 as the cathode plate of the capacitor. This results in very low ESR and improved cap retention at high frequency. The KO-CAP also exhibits a benign failure mode, which eliminates the ignition failures that can occur in standard MnO_2 Tantalum types. KO-CAPs may be operated at voltages up to 80% of rated voltage with equivalent or better reliability than standard tantalums operated at 50% of rated voltage.

The T520 series captures the best features of multilayer ceramic caps (low ESR and high frequency cap retention), aluminum electrolytics (benign failure mode), and proven solid tantalum technology (volumetric efficiency, surface mount capability, and no wearout mechanism).

The KO-CAP can reduce component counts, eliminate through-hole assembly by replacing leaded aluminum capacitors, and offer a more cost effective solution to high-cost high-cap ceramic capacitors.

T525 Series — KO-CAP Polymer Tantalum

The T525 has been targeted for power management applications. This series offers all of the same advantages as the T520 KO-CAP including very low ESR, improved capacitance retention at high frequency and a benign failure mode, to go along with 125°C capability.

T530 Series — KO-MAT Polymer Tantalum

The KO-MAT is an extremely low-ESR, volumetrically efficient, organic tantalum chip capacitor that offers high capacitance retention while preventing thermal events (ignition failures).

Organic polymer does not give up oxygen if the dielectric fails short, thus preventing ignition. Organic polymer is more conductive than MnO_2 — lower ESR.

Higher capacitance retention at higher frequencies means fewer parts are required to achieve the desired capacitance.

The KO-MAT allows tantalum capacitors to be used in circuits never considered possible before, such as input filters. Initial focus is for power supplies and microprocessor circuits

A700 Series AO-CAP Aluminum Organic Capacitors

KEMET's AO-CAP, designated the A700 Series, has been targeted for power management applications. The structure of the AO-CAP uses aluminum as the anode material, aluminum oxide as the dielectric, and a conductive organic polymer for its counter-electrode material. The AO-CAP offers many advantages: • Extremely low ESR • High capacitance retention for superior performance at high operating frequencies • No voltage derating up to 125°C • Robust to the surface-mount process • No dry-out-related failure mechanism

The A700 Series has a molded case and wraparound terminations. This provides strong protection against cracks (flex) making it an ideal alternative to high-capacitance ceramics, and also offers true surface-mountable solutions to the existing aluminum organic capacitors found in the industry. The high-frequency performance of the AO-CAP can reduce component counts, which allows the designer to save board space and offers a more cost-effective solution.

The AO-CAP has excellent surge current performance and long-term reliability. There is no recommended derating of application voltage to reduce failure rate. **Operating Temperature:** -55°C ~ 125°C. The approximate capacitance shift over the temperature range for -55°C is -15%, and for 125°C is +15%. **Capacitance Tolerance:** ±20%

Medium Power Film Capacitors

The FFB and FFV3 series use a non-impregnated metallized polypropylene or polyester dielectric with the controlled self-healing process, specially treated to have a very high dielectric strength in operating conditions up to 105°C. They have been designed for printed circuit board mounting. Furthermore, their performance allows them to be an alternative to electrolytic technology because they can withstand much higher levels of surge voltage. One unique feature of this technology (as opposed to electrolytics) is how the capacitor reacts at the end of its lifetime. With an electrolytic, there is a strong risk of explosion of the case. However, with this line of film capacitors, the capacitor will simply experience a loss of capacitance of about 2% at the end of its life. Please note that this is a theoretical, however, as the capacitor continues to be functional even after this 2% decrease.

Applications: The FFB and FFV3 series are particularity designed for DC filtering, low reactive power.

General Characteristics: • Climactic Category: 40/105/56 IEC 68 (FFV3 Series) 55/105/56 IEC 68 (FFB) • Test Voltage between terminals at 25°C is 1.5 X Vndc

KEMET CHARGED.

Ceramic Conformally Coated Axial Leaded Capacitors “AXIMAX”

The “Aximax” series of multi-layer ceramic capacitors starts with a capacitor element that consists of formulated dielectric materials which have been cast into thin layers, interspersed with metal electrodes alternately exposed on opposite edges of the laminated structure. The entire structure is fired at high temperature to produce a monolithic block, which provides high capacitance values in a small physical volume. After firing, conductive terminations are applied to opposite ends of the chip to make contact with the exposed electrodes.

KEMET leaded ceramic capacitors are offered in the three most popular temperature characteristics: **C0G:** Class 1, with a temperature coefficient of 0 ± 30ppm per degree C over an operating temperature range of -55°C ~ 125°C (Also known as “NP0”). **X7R:** Class II, with a maximum capacitance change of ±15% over an operating temperature range of -55°C ~ 125°C. **Z5U:** Class III, with a maximum capacitance change of 22% - 56% over an operating temperature range of 10°C ~ 85°C. **RoHS Compliant Parts Available**

Ceramic Conformally Coated Radial Leaded Capacitors “GOLDEN MAX”

The “Golden Max” series of multi-layer ceramic capacitors starts with a capacitor element that consists of formulated dielectric materials which have been cast into thin layers, and interspersed with metal electrodes alternately exposed on opposite edges of the laminated structure. The entire structure is fired at high temperature to produce a monolithic block, which provides high capacitance values in a small physical volume. After firing, conductive terminations are applied to opposite ends of the chip to make contact with the exposed electrodes.

KEMET leaded ceramic capacitors are offered in the three most popular temperature characteristics: **C0G:** Class 1, with a temperature coefficient of 0 ± 30ppm per degree C over an operating temperature range of -55°C ~ 125°C (Also known as “NP0”). **X7R:** Class II, with a maximum capacitance change of ±15% over an operating temperature range of -55°C ~ 125°C. **Z5U:** Class III, with a maximum capacitance change of 22% - 56% over an operating temperature range of 10°C ~ 85°C. **RoHS Compliant Parts Available.**

$$\text{Cap. Change} = \frac{\triangle C}{C20} \times 100\%$$

Where C20: Capacitance value in pF at the specified reference temperature of 20°C.
△C: Capacitance drifts in pF from the capacitance value at 20°C over the specified temperature range.

High Capacitance Multilayer Ceramic Chip (MLCC) Capacitors

Now available in capacitance values of 1 µF (in 0402) up to 100 µF (in 1210)

More Options are Available when Choosing Capacitors

Advances in ceramic technology have now increased your choices when selecting the best capacitor for your application. No longer are you restricted to Aluminum Electrolytic, Tantalum or Chip Film Capacitors. High capacitance MLCC capacitors from Panasonic now offer higher capacitance and better performance. The superior reliability, ESR and impedance of MLCCs can now be found in higher capacitance values.

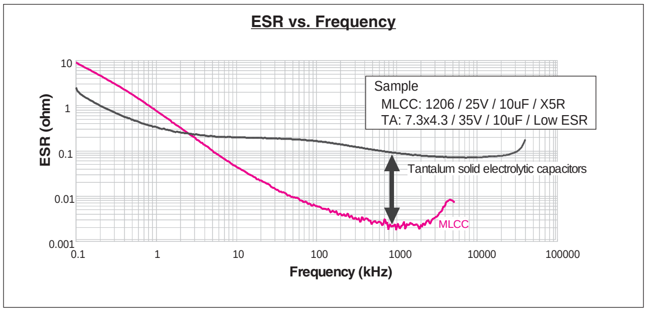
Product Design Benefits

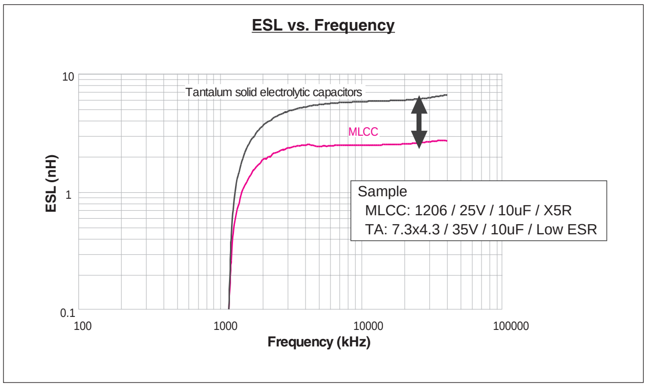
Several technology improvements have made it possible for Panasonic to put more capacitance (1µF and greater) into smaller case sizes (1210 down to 0402) while maintaining the largest possible operating voltage (6.3V up to 50V). These mechanical and electrical characteristics will enable you to make products having smaller size, less weight, increased performance and at a lower cost, thereby making your products more competitive.

Electrical Performance Advantages of MLCCs

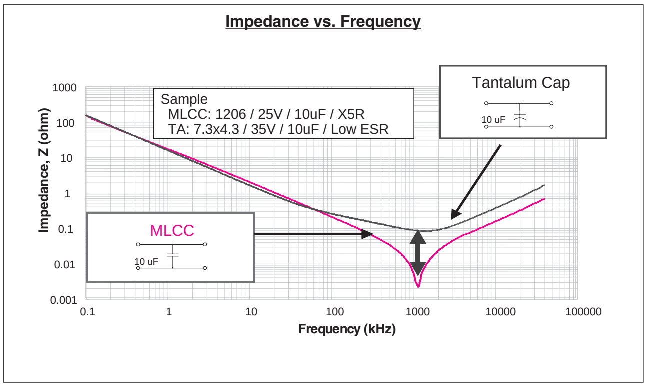
The lower Impedance and Equivalent Series Resistance (ESR) of MLCC Capacitors vs. Tantalum Capacitors, especially at the higher frequencies in the 100kHz to 1MHz range, provides a performance advantage for your decoupling needs.

Lower Equivalent Series Resistance (ESR)





Lower Impedance (Z)



Engineering Kit of High Capacitance Multilayer Ceramic Chip (MLCC) Capacitors is available.

Microwave (Hi-Q) Multilayer Ceramic Chip Capacitors

Now Available in Case Sizes of 0402 (0.1 ~ 15 pF) and 0201 (0.1 ~ 3 pF)

Features and Major Characteristics:

- High-Q values compared to standard MLCCs, due to their unique materials that includes silver inner-electrodes (refer to the graphs)
- Small Case Sizes: 0201 (0.6 x 0.3 mm) and 0402 (1.0 x 0.5 mm) Wide Range of Capacitance Values (0.1 to 15 pF, in 0.1 increments)
- Tight Capacitance Tolerances (as low as + / - 0.05 pF for 0.5 pF and lower)
- Very Stable C0G Temperature Characteristics (0 + / - 30 ppm / °C) 25V Rated Operating Voltage
- Lead (Pb) Free Part Numbers: ECD-G0Exxxx (0402) and ECD-GZExxxx (0201) (Dielectric Materials, Electrodes, and Terminations)

Benefits:

Excellent electrical performance in RF and Microwave circuitry such as Impedance Matching, Resonant Circuits and Coupling.

Typical Applications:

Their small sizes are especially suited for RF and Microwave Circuitry contained within: RF Front-end Modules, Power Amplifier (PA) Modules, Duplexers, Voltage Controlled Oscillators (VCOs), Filter Circuitry (such as Band-Pass Filters), Impedance Matching Circuitry, Resonant Circuitry, Coupling and Bluetooth, Wireless LAN and Modem products.

Hi-Q Kits available in 0201 and 0402 case sizes. Call Digi-Key for details.

Multilayer Ceramic Chip Capacitors

0201, 0402, 0508, 0603, 0612, 0805, 1206, 1210 and 1812

RoHS Compliant Parts Available

FEATURES:

- Small in size and wide capacitance range
- Superior humidity characteristic and long life due to the monolithic construction
- Excellent solderability and resistance to soldering heat due to terminals with three layers of silver nickel and solder
- Low self-inductance and excellent frequency characteristic

RECOMMENDED APPLICATIONS:

Class 1 (T.C. Type): Temperature compensations, tuned circuits and filter circuits, where low loss and high stability of capacitance and high insulation resistance are required.

Class 2 (HI-K type): Coupling and By-pass, where low loss and high stability of capacitance are not so important.

Multilayer Ceramic Chip Capacitors

C0G (NP0) Dielectric: • EIA Class I ceramic materials • C0G (NP0) ceramics offer one of the most stable capacitor dielectrics available • Operating Temperature Range: -55°C ~ 125°C • Capacitance change with temperature is 0±30ppm/°C which is less than ±0.3% Δ C from -55°C ~ 125°C

X7R Dielectric: • X7R formulations are called “temperature stable” ceramics and fall into EIA Class II materials • Its temperature variation of capacitance is within ±15% from -55°C ~ 125°C • Operating Temperature Range: -55°C ~ 125°C

X5R Dielectric: • General purpose dielectric for ceramic capacitors • EIA Class II dielectric • Temperature variation of capacitance is within ±15% from -55°C ~ 85°C • Operating Temperature Range: -55°C ~ 85°C

Y5V Dielectric: • Y5V formulations are for general purpose use in a limited temperature range • They have a wide temperature characteristic of +22%-82% capacitance change over the operating temperature range of -30°C ~ 85°C

Low Inductance Capacitors 0612/0508 IDC (InterDigitated Capacitors)

Very low equivalent series inductance, surface mountable, high speed decoupling capacitor. Measured inductances of 120pH (for 0612) and 95 pH (for 0508) are the lowest in the FR4 mountable device family. Opposing current flow creates opposing magnetic fields. This causes the fields to cancel, effectively reducing the equivalent series inductance. Perfect solution for decoupling high speed microprocessors by allowing the engineers to lower the power delivery inductance of the entire system through the use of eight terminals. Overall reduction in decoupling components due to very low series inductance and high capacitance.
